

REVITALIZING JOINERY

Revitalizing is an easy, quick operation that is important in order to preserve the original appearance of the coating film for a long time.

It must be carried out on a coating film which is in a good state, not damaged by scratches, dents and cracks.

The purpose is as follows:

- to restore the original appearance of the outer protective layer
- to maintain waterproofing
- to maintain elasticity

PROCEDURE

Thoroughly clean the joinery with OECE **986-21** neutral detergent. This work does not require any sanding and is a very simple operation. Use a soft, lint-free cloth to apply either OECE **610-0012/90** reviving oil or OECE **41F-0010/90** water-based product.

Apply the product with circular movements, taking care to remove any excess product. Then allow to dry for several hours before handling the joinery.

Caution: when applied to white surfaces OECE **610-0012/90**, reviving oil tends to turn them yellow. Do not apply too much and do not leave build-ups. The product must be absorbed by the coating film like a cream on skin.

HOW OFTEN

Once a year, after cleaning.

PRODUCTS

OECE **986-21** neutral detergent, OECE **41F-0010/90** water-based reviving product, or OECE **610-0012/90** solvent-based reviving product.
